Advanced users can change the subnet from 192.168.0.x / 192.168.1.x to something like 10.x.x.x. This is an easy way to increase security, because many attacks today are performed by web snippets trying to access the 192.168.0.x / 192.168.1.x addresses (the most common).

**Common Threats and Online Protection | Avast**  
During this brief gap before encryption, attackers can intervene to demote HTTPS to the more vulnerable HTTP. The attacker will then continue to establish an HTTPS connection between himself and the server, and an unsecured HTTP connection with the user, acting as the "man-in-the-middle" between them with access to your data. Packet sniffing
