This text is for anyone interested in the use of Botox and dermal filler agents for a wide variety of functional and minimally invasive facial rejuvenation procedures. The storage, reconstitution, and mechanism of action of botulinum toxin or Botox are all thoroughly explained. A thorough analysis is provided detailing the underlying facial muscle anatomy that is required and how physicians can integrate this procedure into their current practice. An additional section is also included detailing injectable filler agents, a more effective form of treatment for lines that are present at rest. As the demand for less invasive facial rejuvenation products and treatments continue to increase, Botox injections are emerging as the popular choice. While the initial public reaction was guarded, the procedure is now common, as millions of individuals around the world are pursuing the cosmetic application of Botox for wrinkle reduction. The text utilizes a "how to" approach in teaching the ways Botox can remedy many functional disorders and conditions.

Radiofrequency (RF) has been used in many areas of medicine for some time, but only gained popularity in aesthetics in the early 2000s. Although initial procedures provided variable results, the field of RF has grown dramatically. Currently, a multitude of devices which offer an array of technologies, each geared to specific applications, are on the market. In this book, a comprehensive discussion of the evolving area of RF is provided, and the current and cutting-edge technologies which span from noninvasive treatments of facial wrinkles to invasive body contouring procedures are discussed in detail. The methodologies covered include thermal and ablative modalities, volumetric and fractional approaches, as well as practical aspects of application in clinical practice. Included are also pearls on patient management and prevention and treatment of complications. Finally, RF-based procedures are compared with equivalent laser and surgical approaches in a risk-benefit evaluation. Reviewing the standard of care for RF-based treatments and providing information relevant for clinical decision-making and practice management, this publication is a valuable tool for dermatologists, plastic surgeons and all practitioners who use or are contemplating the introduction of RF into practice.

Polymers continue to show almost amazing versatility. We have always known that polymers could be used for trinkets, toys and dishes. Now, however, we are no longer surprised to encounter these adaptable materials in almost every place we look. We find them in our cars, tools, electronic devices, building materials, etc. The use of polymeric materials in medicine is also well documented in previous books by one of the Editors (Gebelein) and by others. Likewise, the use of polymeric materials in pharmaceutical applications, especially in controlled release systems, is also well established. Nevertheless, the use of these ubiquitous chemicals is far less obvious in the field of cosmetics, although modern cosmetic preparations rely heavily on polymers and this trend is certain to increase. This book brings together much of the basic information on polymers in cosmetics and compares this usage with similar applications in pharmaceutical and medical applications. Cosmetics, like medicine and pharmacy, dates back to antiquity. We can find uses of perfumes, balms and ointments in various old books, such as the Bible. For example, the use of ointments and balms is noted more than thirty eight times, and perfumes and related materials are cited at least twenty nine times in the Bible.
