"To all who love the God with a 1000 names and respect science " In the last quarter century, the academic field of Science and Theology (Religion) has attracted scholars from a wide variety of disciplines. The question is, which disciplines are attracted and what do these disciplines have to contribute to the debate? In order to answer this question, the encyclopedia maps the (self)-identified disciplines and religious traditions that participate or might come to participate in the Science and Religion debate. This is done by letting each representative of a discipline and tradition answer specific chosen questions. They also need to identify the discipline in relation to the Science and Religion debate. Understandably representatives of several disciplines and traditions answered in the negative to this question. Nevertheless, they can still be important for the debate; indeed, scholars and scientists who work in the field of Science and Theology (Religion) may need knowledge beyond their own specific discipline. Therefore the encyclopedia also includes what are called general entries. Such entries may explain specific theories, methods, and topics. The general aim is to provide a starting point for new lines of inquiry. It is an invitation for fresh perspectives on the possibilities for engagement between and across sciences (again which includes the social and human sciences) and religions and theology. This encyclopedia is a comprehensive reference work for scholars interested in the topic of ' Science and Religion. ' It covers the widest spectrum possible of academic disciplines and religious traditions worldwide, with the intent of laying bare similarities and differences that naturally emerge within and across disciplines and religions today. The A – Z format throughout affords easy and user-friendly access to relevant information. Additionally, a systematic question-answer format across all Sciences and Religions entries affords efficient identification of specific points of agreement, conflict, and disinterest across and between sciences and religions. The extensive cross-referencing between key words, phrases, and technical language used in the entries facilitates easy searches. We trust that all of the entries have something of value for any interested reader. Anne L.C. Runehov and Lluís Oviedo

"The fifth edition of this highly successful text, An Introduction to Social Psychology has been fully revised and updated. Accessibility for students has been improved, including better illustrations, greater use of colour and a more approachable format, as well as a wealth of online resources. Combining its traditional academic rigour with a contemporary level of cohesion, accessibility, pedagogy and instructor support, the fifth edition of An Introduction to Social Psychology provides the definitive treatment of social psychology"--

"This book is written specifically for the purpose of developing the problem-solving method of education in the field of social psychology. To this end the main attention has been given to the formulation of the "problems" which appear in connection with the themes of each chapter. Each of the problems has been tried out in the classroom and found to produce constructive thought on the part of students. These exercises are intended to set the student at work and to stimulate him to do his own thinking."--Preface. (PsycINFO Database Record (c) 2015 APA, all rights reserved).

An assessment of basic psychological concepts based on the premise that an individual's character is developed in terms of his own uniqueness. Bibliogs

With his 1954 book *The Nature of Prejudice*, American psychologist Gordon Allport displays the crucial skill of reasoning, producing and organizing an argument that was persuasive enough to have a major impact not only in universities, but also on government policy. The question that Allport tackled was an old one: why are people so disposed to prejudice against those from other groups? Earlier psychologists had suggested a number of reasons, especially in the case of racial prejudice. Some had suggested that racism was a learned behaviour, conditioned by negative experiences of other races; others that there was an objective rationale to negative racial stereotypes. Allport, however, reasoned that prejudice is essentially a by-product of the necessary mental shortcuts the human brain uses to process the vast amount of information it takes in. Because our brains want to use as little effort as possible, they regularly fall back on simple stereotypes - which easily generate prejudice. Gathering strong evidence for this hypothesis, he reasoned, clearly and persuasively, that our natural cognitive approach is the most significant factor in accounting for prejudice. Going further still, Allport also reasoned that, once this was better understood, social scientists would be able to influence policy-makers to curb discrimination by law.
