This is a no-nonsense guide to drug treatment in the intensive care unit. It covers the most commonly encountered conditions and is organized by system. Management of each condition is tersely outlined step-by-step in table format. The book also includes non-drug information that is essential to making informed, evidence-based pharmacotherapy decisions, such as risk scores, scales, and assessment tools. The Second Edition has been revised to reflect the latest critical care practice guidelines and up-to-date

drug and non-drug information.

Pharmacogenetics, Kinetics, and Dynamics for Personalized Medicine provides a primer to understand pharmacogenetics (the study of genetic factors that influence how a drug works) in the applied context of pharmacokinetics (how the body handles a drug) and pharmacodynamics (the effects of a drug on the body). This valuable foundation illuminates how these principles and scientific advances can create optimal individual patient care, that is, personalized medicine. Through specific drug examples, this resource explores how the genetic constitution of an individual may lead to the need for an altered dose or in some cases alternative drug therapy. Real-world cases highlight the specific relationships between genetics, drug action, and the body's response as well as adverse drug reactions, altered metabolism, and drug efficacy. Ethical issues concerning pharmacogenomics and study design are also discussed in this concise overview."

Updated with the latest clinical advances, Rowland and Tozer's Clinical Pharmacokinetics and Pharmacodynamics, Fifth Edition, explains the relationship between drug administration and drug response, taking a conceptual approach that emphasizes clinical application rather than science and mathematics. Bringing a real-life perspective to the topic, the book simplifies concepts and gives readers the knowledge they need to better evaluate drug applications.

Exercise and Sport Pharmacology is an essential book for teaching upper-level undergraduates or entry-

level graduate students about how drugs can affect exercise and how exercise can affect the action of drugs. It leads students through the related pathology, exercise physiology, and drug action of many of today's chronically used medications, and discusses how drugs can affect exercise performance. This new second edition of the book is divided into four parts: Section I provides the basics of pharmacology, exercise physiology, autonomic pharmacology, and the stress response; Section II presents chapters on major cardiovascular and respiratory drug classes; Section III describes frequently prescribed medications for such common conditions as diabetes, depression, pain, fever, inflammation, and obesity; and Section IV includes discussions of nutritional supplements and commonly used drugs such as caffeine, nicotine, cannabis, and performance-enhancing drugs. The second edition offers many updates, enhances muscle cell physiology, includes the involvement of the gut microbiome, and each chapter has a new section on the effects of aging. In Sections II and III, chapters include an overview of the pathology that therapeutic drugs are designed to treat and how the drug works in the human body. In contrast to standard pharmacology texts, *Exercise and Sport Pharmacology* also includes the effect of exercise on the pathology of the condition and the effect of exercise on how the body responds to a drug. Each chapter has a section on whether the drugs under discussion have performance-enhancing potential. Section IV is concerned with self-medication and drugs or supplements taken without a prescription or with limited medical supervision. Throughout, figures and tables as well as data from experiments in exercise pharmacology help to illustrate and summarize content. Each chapter opens with an on-going case example to preview and apply chapter content. In the text, boldface terms indicate which concepts are contained in the book's Glossary. Chapters conclude with a Key Concepts Review and Review Questions.
