Recent partisan squabbles over science in the news are indicative of a larger tendency for scientific research and practice to get entangled in major ideological divisions in the public arena. This politicization of science is deepened by the key role government funding plays in scientific research and development, the market leading position of U.S.-based science and technology firms, and controversial U.S. exports (such as genetically modified foods or hormone-injected livestock). This groundbreaking, one-volume, A-to-Z reference features 120-150 entries that explore the nexus of politics and science, both in the United States and in U.S. interactions with other nations. The essays, each by experts in their fields, examine: Health, environmental, and social/cultural issues relating to science and politics Concerns relating to government regulation and its impact on the practice of science Key historical and contemporary events that have shaped our contemporary view of how science and politics intersect Science and Politics: An A to Z Guide to Issues and Controversies is a must-have resource for researchers and students who seek to deepen their understanding of the connection between science and politics.

Based on case studies in Southern Africa, West Africa and East Africa, this book revisits some of the dilemmas and paradoxes associated with the development, management and utilisation of environmental resources, as well as lacklustre official handling of climate change-related challenges, in Sub-Saharan Africa. On the subject of natural resource exploitation, in particular, the book revisits scholarly debates and specific practices around compensation, benefit- and burden-sharing, local participation and space-place dynamics. It highlights fundamental ambiguities in the ways the dominant discourses and policy responses have been framed and mobilised, and examines epistemic and ideational incongruences that have hobbled and sometimes negated the effectiveness of otherwise well-intentioned interventions. On climate change, the book revisits debates around the vulnerability-assets nexus with regard to mitigation and adaptation, as well as the intersection of climate information and livelihoods in agro-based settings. The contradictions, gaps and limitations of climate change policies and strategies in different regions are re-examined based on new data. In the last few years, the Environment and Natural Resources Working Group of the South African Sociological Association (SASA) has intensified efforts to go beyond the annual SASA Congresses and the production of journal articles, in making the research agendas of its members more visible to the global scholarly and policy community. This book is one result of such efforts. It calls for a constant questioning of orthodoxies and the promotion of ethnographically sensitive and epistemologically nuanced scholarly and policy approaches to developmental challenges in Africa, especially in relation to environmental resources and environmental change.

Food safety has fast become one of the nation's top issues. Three thousand people die each year in the U.S. from foodborne illnesses. Another 48 million are sickened annually and our government fails to protect us. Many foods and additives that we eat every day have been banned for years in other countries. Our government food safety agencies move in reverse--cutting back on inspections, allowing food producers to inspect themselves, and permitting the vast majority of potentially adulterated foods to enter this country without benefit of any testing or inspection. How, in a country so advanced in most areas, could we have descended to this alarming state of food safety? One answer: Budget cuts and

bureaucrats. *Eat, Drink, and Be Wary* examines the multitude of dangers in food production, transportation, storing, and preparation that result in this shocking number of preventable illnesses and deaths. It takes a broad and detailed look, in all food groups, at the problems and potential solutions in food safety practices, inspections, and enforcements. This book answers the questions and concerns of millions of Americans who have reached new levels of serious doubts about the safety of our food. Charles Duncan points readers to the dangers to look for in deli foods, raw milk, seafood, poultry, eggs, beef, and others. For consumers who care about the food they eat, this book details the dangers, offers direction for choosing safe foods, and provides a critique of our current system that suggests ways it can be fixed, or at least improved.

The world has become obsessed with the Western notions of progress, development, and globalization, the latter a form of human and economic homogenization. These processes, through the aegis of the United Nations, are comparatively monitored. Those nations deemed to be 'lagging behind' are then provided with foreign aid and developmental assistance. For nearly seventy years, India has sought its place in this global endeavour; yet, even today, abject poverty and backwardness can be observed in districts in almost every state; with the highest concentration of such districts found in the state of Bihar and a cultural enclave, known as Mithila. Development in India has been elusive because it is difficult to define; and because the Western concepts of development and progress have no absolute equivalents within many non-Western settings. As a consequence, development programmes often fail because they are unable to ask the right questions, but equally important is the political economy derived from foreign aid. For politicians, there is no long-term benefit to be derived from successful development. In general, foreign aid only serves to corrupt governments and politicians and, in the end, does very little for those who need help. The struggling states of Bihar and Mithila serve as extreme examples of India's problems. Development here has been thwarted by a hereditary landed aristocracy supported by religion, casteism, custom, social stratification, tradition, and patterns of behaviour that can be traced back millennia. In turn, all these have been masterfully manipulated by co-opted politicians, who have turned politics into a veritable art form as this volume comprehensively demonstrates.

Why small business is not the basis of American prosperity, not the foundation of American democracy, and not the champion of job creation. In this provocative book, Robert Atkinson and Michael Lind argue that small business is not, as is widely claimed, the basis of American prosperity. Small business is not responsible for most of the country's job creation and innovation. American democracy does not depend on the existence of brave bands of self-employed citizens. Small businesses are not systematically discriminated against by government policy makers. Rather, Atkinson and Lind argue, small businesses are not the font of jobs, because most small businesses fail. The only kind of small firm that contributes to technological innovation is the technological start-up, and its success depends on scaling up. The idea that self-employed citizens are the foundation of democracy is a relic of Jeffersonian dreams of an agrarian society. And governments, motivated by a confused mix of populist and free market ideology, in fact go out of their way to promote small business. Every modern president has sung the praises of small business, and every modern president, according to Atkinson and Lind, has been wrong. Pointing to the advantages of scale for job creation, productivity, innovation, and virtually all other economic benefits, Atkinson and Lind argue for a "size neutral" policy approach both in the United States and around the world that would encourage growth rather than enshrine an anachronism. If we overthrow the "small is beautiful" ideology, we will be able to recognize large firms as the engines of progress and prosperity that they are.

Millions of people are already affected by weather-related shocks every year in West Africa and climate change is highly likely to increase these threats. In the wake of climate change, rising temperatures, increasingly irregular rainfall and more frequent natural hazards will endanger the ways of life of vulnerable population groups in this region and destabilize their human security. A surge in violence and conflicts could take place. One of the conflict constellations could be between farmers and herders. These groups are highly vulnerable to climate change due to their dependence on natural resources

Millions of people are already affected by weather-related shocks every year in West Africa and climate change is highly likely to increase these threats. In the wake of climate change, rising temperatures, increasingly irregular rainfall and more frequent natural hazards will endanger the ways of life of vulnerable population groups in this region and destabilize their human security. A surge in violence and conflicts could take place. One of the conflict constellations could be between farmers and herders. These groups are highly vulnerable to climate change due to their dependence on natural resources for their subsistence. Furthermore, they are historically prone to enter into conflict over issues of access to natural resources. However, social, economic and political circumstances fundamentally influence environmental conflicts. There might thus be opportunities to face the societal challenges of climate change in a peaceful way and the political and institutional framework could play an important role in reducing conflict and violence. In order to explore such a path, this study analyses the potential of political factors (policies and institutions) for the reduction of climate-change-induced or aggravated conflicts between farmers and herders. After a theoretical demonstration, a case study of agro-pastoral conflicts in Burkina Faso, Côte d'Ivoire, and Ghana is conducted. their subsistence. Furthermore, they are historically prone to enter into conflict over issues of access to natural resources. However, social, economic and political circumstances fundamentally influence environmental conflicts. There might thus be opportunities to face the societal challenges of climate change in a peaceful way and the political and institutional framework could play an important role in reducing conflict and violence. In order to explore such a path, this study analyses the potential of political factors (policies and institutions) for the reduction of climate-change-induced or -aggravated conflicts between farmers and herders. After a theoretical demonstration, a case study of agro-pastoral conflicts in Burkina Faso,

Côte d'Ivoire, and Ghana is conducted.

Including considerations of sustainability in universities' activities has long since become mainstream. However, there is still much to be done with regard to the full integration of sustainability thinking into science and engineering curricula. Among the problems that hinder progress in this field, the lack of sound information on how to actually implement it is prominent. Created in order to address this need, this book presents a wealth of information on innovative approaches, methods and tools that may be helpful in translating sustainability principles into practice.

The two-volume set IFIP AICT 419 and 420 constitutes the refereed post-conference proceedings of the 7th IFIP TC 5, WG 5.14 International Conference on Computer and Computing Technologies in Agriculture, CCTA 2013, held in Beijing, China, in September 2013. The 115 revised papers presented were carefully selected from numerous submissions. They cover a wide range of interesting theories and applications of information technology in agriculture, including Internet of things and cloud computing; simulation models and decision-support systems for agricultural production; smart sensor, monitoring, and control technology; traceability and e-commerce technology; computer vision, computer graphics, and virtual reality; the application of information and communication technology in agriculture; and universal information service technology and service systems development in rural areas.

Food production and consumption is no longer a traditional activity. Every day we make choices that influence not only our health, but also that of other living beings, and our planet. Our food cultures are changing rapidly. Do we still know our food? And if not, is that a bad thing? This book presents the state of the art in agriculture and food ethics. It considers a wide range of ethics and innovation topics in agriculture, aquaculture, markets, consumption and food culture. Its multi-disciplinary analysis by the many authors helps to understand our current global challenges. At the same time it opens a wide range of new possibilities for future debate, research and reflection towards a sustainable world. The book will appeal to anyone interested in agriculture, animal and food ethics. To students and people looking for a quick overview it offers a wide range of issues. Experienced readers will find a deepened analysis and new themes and perspectives adding to the existing body of knowledge.
